Infrastructure Hygiene & Physical Layer Protection

Our Health & Hygiene Audit provides structured, data-driven insights to support infrastructure reliability, airflow performance, and audit readiness in live IT environments.

Audit Summary

Category	Description
Environment	Server Room / Data Center
Focus	Rack, Cable, Airflow & Contamination
Method	ESD-aware, non-disruptive
Output	Visual + Observational Report

What's Inside the Report

Real-time Particle Observation: PM2.5 and PM10 readings aligned with ISO Class 8 environmental expectations.

Invisible Risk Assessment: Identification of airflow restriction, dust accumulation, and thermal risk indicators.

Compliance Alignment: Documentation structured to support NFPA 75 and general audit readiness practices.

Actionable Recommendations: Clear steps to improve airflow, reduce contamination, and stabilize infrastructure conditions.

Why This Matters

- Dust buildup can restrict airflow and increase thermal load.
- Contamination can impact fiber reliability and performance.
- Poor hygiene increases operational and equipment risk.
- Uncontrolled environments reduce long-term system efficiency.
